

Single Widget XML Instructions

All our flash products load in an XML file that tells the widget to display. It's easier than it looks so don't be afraid to try it out. If you have any questions please contact us at support@devcredits.com.

The widgets include links to Home Page, Catalog, Product, Derive, and Shopping Cart. Several of these can be turned on or off. The Shopping Cart function has an offsite PHP function that allows it to work with IMVU; it's necessary and does not collect any information.

Step 1: Open the XML file in notepad to edit it; below you will find the options and what you can change. The basic setup for the XML is a lot like HTML; so if you're familiar with HTML you'll find this pretty easy. You only need to edit between the <product> and </product> tags

Editing the Product Information Section:

The Product information section is where you will enter your products information allowing you to sell your items in client. Please Avoid apostrophe's and other similar characters.

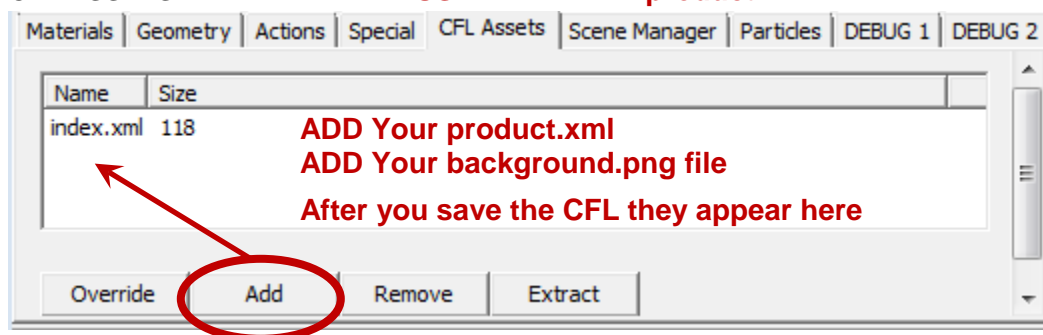

```
<bgimage>background.png</bgimage> - The background image for the widget 229 wide x 244 high
<startclosed>0</startclosed> - Sets the Sales Panel to be open or closed when it loads ("0"=Closed and "1"= Open)
<id> 4184488</id> - The PID for the product
<title IMVU Flash Project</title> - Product Title as displayed in the widget
<author>Tidy</author> - This is the Product Author - Displayed in Client
<autid>6529645</autid> - Manufacturers ID - Used to send people to the Catalog
<price>399</price> - Product final price - Displayed in Client
<image> http://www.imvu.com/catalog/index.php?manufacturers_id=6529645</image>
    Icon image from product page (or any internet link to a 100x80 image) can be cut and pasted from IMVU.
<mature>0</mature> - Set to "0" for GA and "1" to AP (displays AP graphic)
<derive>1</derive> - Turns the Derivable link on or off ("0"= Off and "1"= On)
<home>1</home>- Turns the Developers Home Page Link on or off ("0"= Off and "1"= On)
<cat>1</cat> - Turns the Catalog Link on or off ("0"= Off and "1"= On)
<tryit>1</tryit> - Sets the Try It button - for customers to try on clothes ("0"=Off and "1"= On)
<desc><![CDATA[This is the <b>master
product</b> of the Flash Product Info box you are now viewing.]]></desc>
```

The description text supports basic html only. There is no side scroller for this box so be careful how wide you make any images inside the description (190 or so). The text can be as long as you want, so you can give detailed information about the product. The description text must be contained within a CDATA tag, or the XML will fail causing the flash interface to fail.

Step 2: Upload the file to the CFL Assets Tab.

Once you have your edits save your file under the same file name and upload it on the CFL Assets tab to replace the xml file that is there, check spelling and capitalization.

CFL ASSETS TAB - *****XML MUST BE NAMED product.xml*****

NOTE: - You will not see these files when you derive but using the Add button WILL replace them

NOTE: - The Flash will not show up in Previewer, Flash isn't supported in Previewer. You will need to test the FLASH in Client.

NOTE: - Dragging your XML into Internet Explorer can help Diagnose Problems with your file.
